

What can Rail Operational Development do for you?

Train service performance improvement and service control & recovery plans

RODL can:

- Undertake train service performance reviews,
- developing reliability and punctuality strategies and
- action plans

To meet business needs and franchise commitments

RODL has been engaged in the development of Service Control and Recovery Plans, which resulted in the production of robust arrangements for train regulation, adverse weather contingency, management of service disruption and connections.

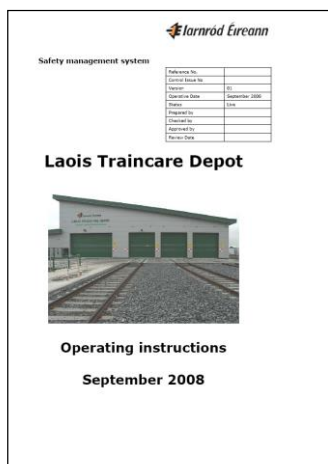

We have developed the Service Control and Service Recovery Plans incorporating Performance Improvement Plans for a number of clients and supported their implementation.

We developed contingency plans which included the utilisation of diversionary routes coupled with the cost effective arrangements of train driver route knowledge acquisition and retention arrangements.

Depot operations service delivery plan

We have developed and delivered train service scenarios to test the robustness of the railway operational systems of work regarding train arrivals and departures at a major train depot.

This led to changes which optimised the requirements of train maintenance and train service delivery.

Route learning and risk assessment

At the end of the day, outside of basic Operator training, route learning and route refreshing is probably your biggest non productive cost.

Wouldn't it be nice to reduce this cost!

RODL have the ability, knowledge and track record to support companies achieve this.
